Retellus for Windows is a useful application that records what you type, and can save it as a text file. This makes it possible for you to track your own results in case you are in a hurry and need to use an old or disabled keyboard to compose messages or fill in forms on the web. The app is capable of working both with a USB keyboard or the one you have on your Windows machine. The latter choice requires that you select the keyboard and make sure the Language and the Key Map options are set correctly. If you choose the USB keyboard, you will have the option to set the delay time in milliseconds between typing a letter and pressing the button. The most relevant parameters of this set are the delay between the PgUp and PgDn keystrokes, because those keys have to be pressed and released in order to move the cursor up and down. Another important aspect to consider is that when you are using the wireless keyboard, you can choose between the 100% key rate and the 50% key rate that retellus offers. For a detailed tutorial on how to use the program, check out the manual. Retellus for Windows has been tested on Windows 7.
